

ToteGlass®
You'll Notice the Difference!

Safety and Handling

The following instructions should always be observed!

- Growlers are fragile glass vessels, please treat them accordingly.
- Do not wash the growlers with high pressure or unapproved bottle washing machines and avoid leaving the growlers in highly concentrated washing chemicals for extended periods of time. Clamp the porcelain lid open with a heavy rubber band or other strapping device to keep it from striking and chipping the bottleneck.
- Place the porcelain lid carefully in the center of the bottleneck so that the clasp can spread pressure equally all over the sealing ring. Do not leave the porcelain head unclamped while handling, as it can strike and chip the bottleneck's opening.
- Remember that growlers have to adapt to different temperatures during the transport between the place of storage and filling. These growlers are more sensitive to temperature shifts than regular beer bottles; especially temperature differences of more than 40° Celsius (104° Fahrenheit).
- To avoid scarring do not allow the growlers to touch each other during transport.
- Remember that growlers are not approved for the transport or storage of unknown or dangerous liquids.
- For the filling process, use only tested or approved devices which must be equipped with a splinter protecting device.
- Never fill the growlers beyond the molded-in gauging line, so the necessary remaining space can compensate potential pressure fluctuations (movement, temperature, etc.).
- To achieve 100-percent seal for long-term storage, place the porcelain lid of the beer growler carefully in the center of the bottleneck so the clasp can spread pressure equally all around the sealing ring.
- When filling the growler repeatedly, pay attention that the rubber washer is in perfect condition (check for wear and tear).
- Never place materials on top of a pallet of growlers. **DO NOT DOUBLE STACK!**

*Please note that our growlers are registered in U.S. Patent & Trademark office.
